Table 1. Properties of the raw, tweaked, and centroid grids; numerical columns are for grid levels 4 through 8. ArcA is arc between adjacent primary cell corners or momentum cell centers. ArcC is arc between nearby primary cell centers or momentum cell corners. Point D is intersection of ArcA and ArcC. Radius is square root of cell area divided by $2 \pi$. Ideal number is 1 for the first nine properties; ideal is 0 for last two properties.
